Fourteen pregnant, crossbred gilts were utilized in this study. In this second embodiment, the recipient male will produce both offspring which are genetically identical to itself as well as offspring genetically identical to the donor animal.

It is noteworthy that the ratio of labeling index in foci on non-involved hepatic

Following colonization of recipient seminiferous tubules, donor cells generally established a morphological pattern representative of normal spermatogenesis. Viable yellow mice provide an excellent model in which to manipulate epigenetics and observe epigenetic phenotype e.

Although lithologic variations largely influence the local deformation pa

T. The experiments described below, which The Bucci Strain: Imprint provided for purposes of non-limiting illustration of some embodiments of the invention, demonstrate the survival, differentiation and development to enter stages of spermatogenesis of cells transferred in accordance with the invention and the cross-strain utility of the invention, and thereby provide strong evidence of the cross-species potential of the present invention.
